

Belt conveyor

- ✓ Modular design
- ✓ Robust construction

Our belt conveyors feature a modular design and are available in lengths and widths tailored to the dimensions of the lumber being transported, as well as the required conveying distance.

The belt conveyor consists of multiple interconnected troughs, with support at all joints. The troughs feature step-bent sides and flanged edges for enhanced stability and load-bearing capacity.

The belt itself has a seamless design and is delivered either as a finished unit or is vulcanized on site during installation. It is driven by an electric motor directly coupled to the drum that powers the belt.
