

Cross conveyor

- ✓ Heavy-duty design
- ✓ For Merry-go-round system

The Cross conveyor is a transverse conveyor, responsible for moving the workpiece sideways to return it to the beginning of the line in the loop of a Merry-go-round sawline.

Consists of multiple sections, some of which are movable to be retracted when the return loop is not active. The structure features a heavy-duty design to handle the load of large workpieces.

Chain drive is powered by electric motors, while motion control is achieved through pneumatic cylinders.

The Cross conveyor is available with a wide range of options, including stop hooks, dog chains, and hydraulic cylinders.
